

Project: Democratizing Compute — The ASEAN Grid

The Anti-Fragile, Decentralized GPU Yield Optimizer Infrastructure for Southeast Asia.

A Non-Restrictive Open Architecture Guided by Frontier Computing, Bridging Global AI Demand with Regional Consumer Power — powered by a Hybrid "Prepaid API / On-Demand" Monetization Architecture.

EXECUTIVE SUMMARY / บทสรุปผู้บริหาร

us ENGLISH

In the current era of the **Global Compute Crisis**, centralized Big Tech data centers are hitting structural walls —facing energy caps, real-estate limits, and severe geopolitical chip sanctions. Meanwhile, billions of dollars worth of high-end consumer hardware sits idle inside gaming rigs and cyber cafes.

"**The ASEAN Grid**" is a revolutionary, decentralized, and light-asset infrastructure that synthesizes fragmented GPU computing power across Southeast Asia into a unified, high-speed supercomputing monolith. By establishing an advanced **Hybrid Monetization Architecture (SaaS Subscription + Prepaid On-Demand API Token)**, we create a direct pipeline routing global AI training and high-fidelity streaming revenues straight back to local node providers and our network ecosystem.

TH ภาษาไทย

ท่ามกลางวิกฤตการณ์ **Global Compute Shortage** (การขาดแคลนพลังประมวลผล AI) และกำแพงภูมิรัฐศาสตร์ที่ทำให้ห้องแล็บ AI ยักษ์ใหญ่ทั่วโลกต้อง "ติดหล่มเทคโนโลยี" เนื่องจากคลาวด์ศูนย์กลาง (Centralized) มาถึงทางตัน... เราไม่ได้มาสร้างแอปพลิเคชันทั่วไป แต่เรากำลังสร้าง "โรงไฟฟ้าดิจิทัลกระจายศูนย์แห่งภูมิภาคอาเซียน"

โครงการนี้จะเปลี่ยนพลังงานที่ซ่อนอยู่ — คือคอมพิวเตอร์สเปกเทพตามบ้านและร้านอินเทอร์เน็ตคาเฟ่นับหมื่นแห่งทั่วเอเชียตะวันออกเฉียงใต้ — ให้กลายเป็นเครือข่ายซูเปอร์คอมพิวเตอร์ขนาดยักษ์ (ASEAN Compute Consortium) เพื่อทำหน้าที่รับส่งและประมวลผลคำสั่ง AI และสตรีมมิ่งความเร็วสูง ผ่านโมเดลธุรกิจที่สมบูรณ์แบบที่สุดคือ "**SaaS Subscription + Prepaid API Token (On-Demand)**" ดึงเม็ดเงินดอลลาร์สด ๆ จากทั่วโลกไหลเข้ากระเป๋าตลอด 24 ชั่วโมง โดยไม่ผ่านระบบราชการ

THE DISRUPTIVE HYBRID REVENUE MODEL (โมเดลธุรกิจฟาด 2 ขา — Prepaid API / On-Demand)

Our platform unlocks unprecedented cash flow liquidity by dual-targeting the market via a hybrid financial matrix:

Real-Sector Tokenomics Moat (คู่มือหรือสมุดค่าจริง ไม่ใช่ฟองสบู่)

Unlike speculative bubble assets, our platform's native token utility is rigidly driven by strict **Real-Sector Economics**:

- **Staking Deficit:** Home users and internet cafes *must* purchase and stake a specific volume of tokens to validate their hardware nodes and ensure zero-fraud uptimes.
- **Buyback & Burn Loop:** A dedicated **3% - 5% System Fee** captured from global enterprise API billing is continuously routed to buy back tokens from the open market and burn them, systematically creating a permanent upward asset appreciation loop reminiscent of NVIDIA stock.
- **Prepaid Liquidity:** The API top-up model (styled after OpenAI/Kimi API wallets) generates **upfront cash flow** before any compute second is consumed — a financial flywheel that funds operations and hardware expansion ahead of demand.

HOW TO JOIN THE GRID / IMPLEMENTATION STEPS (ขั้นตอนปฏิบัติจริง)

Step 1: Lock the Blueprint (ปิดหมุดพิมพ์เขียว)

- Repository: `asean-compute-yield-optimizer` (Public) with **AGPL-3.0 License** — legally forces any derivative enterprise software clones to remain open and transparent, destroying Big Tech's ability to privatize our business logic.

Step 2: Deploy the README (ประกาศวิสัยทัศน์สู่สากล)

- Publish this blueprint (TH/EN) as the repository front page — attract global developers (5% Dev Treasury) and investors (Geopolitical Arbitrage opportunity).

Step 3: Initialize the Data Pipeline (เตรียมระบบหลังบ้านเว็บรถเช่า)

- Cursor Composer: build `/backend/data-pipeline` to log user behavior + fleet availability (28-car fleet) for downstream **AI Fine-Tuning** — the continuous marketing engine that keeps the rental business

selling 24/7.

Step 4: Aggregate the Supply (ระดมพลฝั่งอุปทาน)

- Onboard internet cafe chains and home PC registries across Thailand and Vietnam (Phase 2 — ASEAN Alpha Grid), then open the Nous Strategic Corridor (Phase 3).

🔥 ALLIANCE OPEN INVITATION (สาส์นชี้ชวนถึงคนเก่งและนักลงทุน)

💻 For Developers: The 5% Treasury Fund (กองทุนสำหรับห้วกะทิ)

- **The Guideline:** Our baseline roadmap uses the open-source breakthroughs of **Nous Research (DisTrO & Psyche network frameworks)** as a primary technical direction, bypassing the need to build cross-border low-bandwidth compression algorithms from scratch.
- **Open Tech Autonomy:** We reject rigid vendor lock-ins. Our repository is an **Open Architecture**. If you possess an optimized container topology, a superior smart contract flow, or a sharper localized electricity calculator—**fork this repo, submit a PR, and show your worth.**
- **The Incentive:** An immutable **5% Developer Treasury Pool** built into our system smart contracts distributes platform revenues directly to contributors who maintain core microservices and security protocols.

💰 For Investors: Geopolitical Arbitrage (ถึงนักลงทุนกระเป๋านัก)

- **The Opportunity:** Capitalizing on the high-end chip squeeze in East Asia, we are capturing a multi-billion-dollar regional computing monopoly. We bypass capital-heavy hardware procurement by crowdsourcing idle, pre-existing consumer nodes.
- **The Exit Strategy:** We are driving this venture towards an institutional acquisition and multi-billion baht valuation. We look for Angel Visionaries who understand foundational internet infrastructure and cashflow-backed assets to capitalize on Phase 1 development.

🔧 THE IMPLEMENTATION ROADMAP (แผนการปฏิบัติจริง)

Phase 1: The Blueprint & Structural Lockdown (CURRENT PHASE)

- **Action:** Lockdown intellectual property on GitHub utilizing the global **AGPL-3.0 License**. This legally forces any derivative enterprise software clones to remain open and transparent, destroying Big Tech's ability to privatize our business logic.
- **Cursor Integration:** Initialize the structural backend data pipelines (`/backend/data-pipeline`) in Cursor Composer to map user activity logs and fleet availability loops for downstream model adjustments.

Phase 2: Supply Aggregation (ASEAN Alpha Grid)

- Onboard local internet cafe chains and home PC registries across Thailand and Vietnam to stress-test the container sandbox environment under mock rendering loads.

Phase 3: The Nous Strategic Corridor

- Bridge communication channels with **Nous Research (US)** using our regional hardware cluster as data proof, negotiating a primary advisory tier and formal network expansion alliance.
-

Join the Framework

1. **Developers:** Review our issue tracker, submit pull requests for backend pipelines, and claim your share of the 5% Developer Pool.
 2. **Node Providers:** Register your hardware specifications (Minimum 16GB VRAM recommended) to join the local testing registry.
 3. **Angel Visionaries:** Open a private channel with the Founder to review the regional infrastructure growth matrix.
